No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  9
                                                                                                                                                                                                                                                                         The present sequence encodes the human HER-2/neu protein. HER-2/neu is a member of the tyrosine kinase family of receptor-like glycoproteins and shows homology to the epidermal growth factor receptor (EGFR). It probably plays a part in cell growth and/or differentiation. The HER-2/neu gene is an oncogene. An HER-2/neu fusion protein comprising a HER-2/neu extracellular domain fused to a HER-2/neu phosphorylation domain may be used to treat or prevent cancer by eliciting or enhancing an immune response to the HER-2/neu protein. It may be used to treat malignancies such as breast, ovarian, colon, lung and prostate cancers, and may be used as an antigen to vaccinate against

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     80
                                                                                                                                                                                                                                                                                                                                                                     20
                                                                                                                                                                                                                                                                                                                                                                                        9
                                                                                                                                Human HER-2/neu oncogene cDNA (AAT40739) codes for HER-2/enu (p185 or c-erbB2) protein (AAW01111). The oncogene is overexpressed in various cancers, including breast, ovarian, colon, lung and prostate, and appears to induce malignancies through quantitative mechanisms that result from increased or dergulated expression of an essentially normal gene product. Nucleotides 2026-3765 of the cDNA sequence code for the intracellular domain (Lys676-vall255) of the HER-2/neu protein, which is useful for immunisation against malignancy. Nucleic acids can be used to direct expression of the intracellular domain in transformed host cells, or are used, alone or in a viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               IleValArgGlyThrGlnLeuPheGluAspAsnTyrAlaLeuAlaValLeuAspAsnGly

Ç
         immune response
for treating or
an HER-2/neu associated malignancy, particularly preventing tumours
```

Column 23-32; 26pp; English. Claim la;

This sequence encodes the human HER-2/neu oncogene protein. A fragment of this protein is used in a method for eliciting or enhancing an immune response to HER-2/neu protein. The polypeptide can stimulate T cells and B cells to produce an immune response to the HER-2/neu protein. The method can be used for immunisation against a malignancy in which the HER-2/neu oncogene is associated and in the treatment of an existing tumour, or to prevent tumour occurrence or reoccurrence.

```
an isolated antigen-presenting cell, which immunogenic portion of a polypeptide that produces PREX_Z/new protein. The antigen-presenting cells are electring or enhancing an immune response to itcularly in treating or preventing malignancies in preventing cancer, e.g. breast cancer, ovarian, preventing cancer, e.g. breast cancer, ovarian, a cancers. The present sequence represents a DNA-Z/new protein (also known as pl85 or c-erbb2).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     lCysThrGlyThrAspMetLysLeuArgLeuProAlaSerProGlu 40

target gene by introducing into the coll that contains the target gene at least one oligoribonucleotide (dsRNAI) that has a double-stranded (ds) structure of not more than 49 consecutive nucleotides (nt), where at least a segment of one strand of the ds structure is complementary with the target gene and the cells are treated with interferon before introduction of dsRNAI. The method is used to inhibit expression of trarget genes, particularly oncogenes, cytokine genes, id (not define) protein genes; developmental or prion genes, or genes expressed in pathogenic corganisms (particularly plasmodia) or in viruses or virolds (pathogenic in humans, animals or plants). Treating the cells with interferon greatly increases the extent to which dsRNA can inhibit expression of the target genes, and the effect is even greater when dsRNA are modified to increase their stability. The invention relates to a transgenic non-human mammal that produces in its mammary gland cells detectable levels of a native human HER2 protein or its fragment. The transgenic animals are useful as tumour models for testing HER2-directed cancer therapies, and for identifying anticancer agents. The animals may also be used as source of cells which can be immortalised in culture, in screening for compounds that have potential as prophylactic or therapeutic treatments of diseases or disorders involving expression of HER2. The anti-cancer molecules are useful for inducing apoptosis or cell death of cancer cells. The present sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a method for inducing or enhancing an immune response against a polypeptide antigen in an animal, including human. The method comprises administering the polypeptide antigen or at least one variant which includes at least one first Thelper cell epitope that is foreign to the animal (foreign TH epitope) and is formulated with chitosan. The polypeptide antigen is weakly immunogenic or non-immunogenic. The invention is used as vaccine. The chitosan and

                                                                     The invention relates to inhibiting expression of a target gene (I) in a cell by introducing an inhibitory RNA (dsRNA1) having a double-stranded structure of at most 49 consecutive bases. At least part of one strand (asl) of dsRNA1 is complementary to (I) and at least one end of dsRNA1 has an overhang of 1-4 nuclectides. The method is used to inhibit the expression of a wide range of genes, e.g. oncogenes, cytokine genes etc. In humans, also genes in Plasmodium or in viruses or viroids that are pathogenic for humans, animals or plants. Introducing an overhang into dsRNA greatly increases effectiveness for inhibiting gene expression, both in vivo and in vitro and also increases stability and thus the effective concentration inside the cell. The present sequence is that of
                                                                                                                                                                                                                                                                                                                                                                                      dsRNA1; gene expression inhibitor; oncogene; cytostatic;
Inhibiting expression of target gene, useful e.g. for inhibiting oncogenes, by administering double-stranded RNA complementary to target and having an overhang
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an isolated Her-2/Neu polypeptide composition effective for eliciting an immune response. The invention is useful for eliciting an immune response. The invention is useful for eliciting an immune response in a patient, where the patient is human composition is useful for the therapy and diagnosis of cancer. The composition is useful for the therapy and diagnosis of cancer. The compositions for the diagnosis, prevention and treatment of can do other compositions for the diagnosis, prevention and treatment of thuman malignancies, for stimulating and/or expanding T cells specific for Her-2/Neu polypeptide and for inhibiting the development of cancer in a patient. The invention is useful for stimulating a T cell response in a cumman patient, as probe or primer for nucleic acid hybridisation, to selectively form duplex molecules with complementary stretches of the entire Her-2/Neu gene or gene fragments of interest, to isolate a full complypatide in appropriate host cells. The composition is useful in prophylactic or therapeutic applications and for the treatment of cancer, preferably for the immunotherapy of breast cancer and other Her-2/Neu-composition is useful in gene therapy. The present sequence is that of human Her-2/neu oncogene cDNA.

The CDNA encodes Her-2/neu (p185), an oncogenic self protein and carget for anti-cancer vaccines. The Her-2/neu gene is amplified and p185 is overexpressed in a variety of cancers, including breast, ovarian, colon, lung and prostate cancer. Her-2/neu is a member of the tyrosine kinase family of receptor-like glycoproteins.

Its overexpression correlates with a poor prognosis in breast and ovarian cancers. The invention provides Her-2/neu fusion proteins proteins nucleic acids encoding them, viral vectors, and vaccines comprising the fusion proteins or nucleic acid molecules. In preferred fusion proteins or nucleic acid molecules. In protein is fused to a Her-2/neu intracellular domain of a Her-2/neu protein is elicited or enhanced by administering the fusion protein is elicited or enhanced by administering the fusion protein in the form of a vaccine, or by cransfecting cells of an animal ex vivo with a nucleic acid cells of concern especially breast, ovarian, coloir, lung or prostate cancer in a patient. T cells that specifically react with a Her-2/neu in class of the cancer in a patient. T cells that specifically react with a Her-2/neu in class of the color of a cancer in a patient. T cells that specifically react with a Her-2/neu in class of the concern color can be asset to remove tumour cells from a sample in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Her-2/neu fusion protein for treating or preventing cancer by eliciting or enhancing an immune response to the protein, has Her-2/neu extracellular domain fused to Her-2/neu intracellular or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  rusion protein can be used to remove tumour cells from a sample in order to inhibit the development of cancer in a patient.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a method for inhibiting development of haematological malignancy in a patient by administering a polypeptide comprising an immunogenic portion of Her-2/neu or a polynuclectide encoding the polypeptide. Antigen presenting cells that express the protein can also be administered. The sequences are used for inhibiting development of haematological malignancy such as acute myelogenous leukaemia (AML), chronic myelogenous leukaemia (CML), chronic lymphocytic leukaemia (CLL), MDS, myelomas, Hoddykin's lymphoma and non-Hoddykin's lymphoma. This sequence represents DNA encoding human Her-2/neu

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    40
                                                                                                                                                           The invention relates to a method for inhibiting expression of a target gene (ABL91658-ABL91797) in a cell by introducing at least one oilgoriboniclectide that has a double-stranded structure consisting of a most 49 sequential nuclectide pairs, with at least part of one strand complementary with the target gene and has at least one end a single-stranded segment of 1-4 nt. The method provides oilgoribonuclectides for antisense inhibition of gene expression useful e.g. for treating tumours but the oilgoribonuclectides may also be viruses/viroids, pathogenic on humans, animals or plants) or against cytokine, id, developmental or prion genes. The method provides more effective inhibition of gene expression than use of known oilgonuclectides, probably because the unpaired overhang increases

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
